Dear Hiring Manager,

I am writing to apply for a Software Engineer position. As a final-year Computer Science student at the University of Indonesia with hands-on experience architecting backend systems in Go, Django, and Laravel, and a track record of leading engineering teams, I am confident I can contribute to your engineering organization from day one.

Most recently, as a volunteer AI & Back End Engineer at Intergalactic Science Kingdom, I architected *Marie Chan*, a full-stack system combining Go and Django backends, and applied BDD/TDD workflows to keep the codebase reliable as the team shipped quickly. Earlier, at Candidate College, I built and maintained RESTful APIs and database architectures in Laravel, led Swagger-based API documentation as Co-Head of the Website Development Division, and implemented CI/CD pipelines and test suites that improved deployment reliability. At SIKAP, I engineered a cross-platform anti-bullying reporting system (Django + Flutter) and validated it through UAT across dozens of Indonesian schools, grounding my engineering decisions in direct user feedback.

Beyond individual contribution, I have led technical teams: as Coordinator of the IT Division at BEM UI, I directed software development workflows and provided architectural guidance across multiple concurrent projects, and I currently serve as a Teaching Assistant for Software Engineering Project and Operating Systems courses. This combination of production engineering experience, system design judgment, and team leadership is what I would bring to your team.

I would welcome the opportunity to discuss how my background in backend architecture and software engineering leadership can support your team's goals. Thank you for your time and consideration.

Sincerely,
Darrel Danadyaksa Poli
